

PHI ATTACK

REWRITING THE JAVA CARD CLASS HIERARCHY

Jean DUBREUIL
j.dubreuil@serma.com

Guillaume Bouffard
guillaume.bouffard@ssi.gouv.fr

AGENDA

Java Card Platform

- ▶ Java Card Security Model
- ▶ Loading process description

PhiAttack

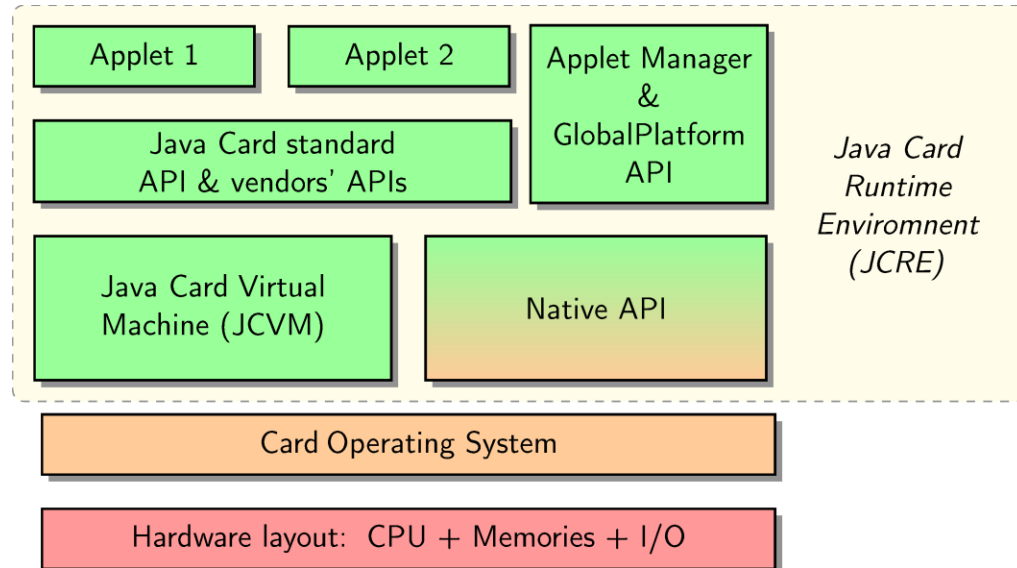

- ▶ Fooling the loading mechanism
- ▶ Exploitation
- ▶ How to prevent from such an attack ?

JAVA CARD SMART CARD

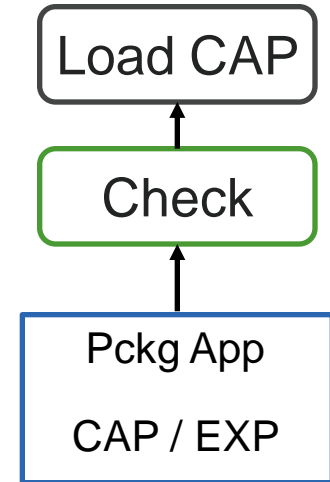

Java VM embedded on secure component (constrained device)

- ▶ Specified by Oracle
- ▶ Applications segregated by firewall
- ▶ **Latest products embedd version 3.0.5**
- ▶ Loading specified by GlobalPlatform

APPLET LOADING

- ▶ Issuer (ISD / Authorized Management) -> **Trusted**
- ▶ Verification Authority (VASD / Mandated DAP) -> **Trusted**
 - ⋮ Verification performed based on product security guidance (BCV, etc.)
- ▶ Application developer
 - ⋮ When **trusted** -> everything is fine
 - ⋮ When **not trusted** -> only VA prevents malicious code loading

PHI ATTACK – BIBLIOGRAPHY (1/2)

Malicious Code on Java Card Smartcards – Mostowski and Poll – 2008

- ▶ Abuse Shareable interface using modified EXP file
 - ⋮ server.cap, server.exp
 - ⋮ client.cap -> compiled with modified_server.exp
 - ⋮ Allows type confusions
- ▶ Verification Authority keeps all exp files corresponding to loaded cap
 - ⋮ Verification detects that client.cap is not consistent with server.exp

PHI ATTACK – BIBLIOGRAPHY (2/2)

Accessing Secure Information using Export file Fraudulence – Bouffard, Khefif and Lanet – 2013

- ▶ Man in the middle
 - ∴ Malicious app developer: provides a fake API
 - ∴ Victim app developer: app.cap -> compiled with fake API export files
 - ∴ Allows interception of any call to API methods

- ▶ Verification Authority has legitimate API export files

- ▶ Difficult to send fake export files to the victim developer

PHI ATTACK

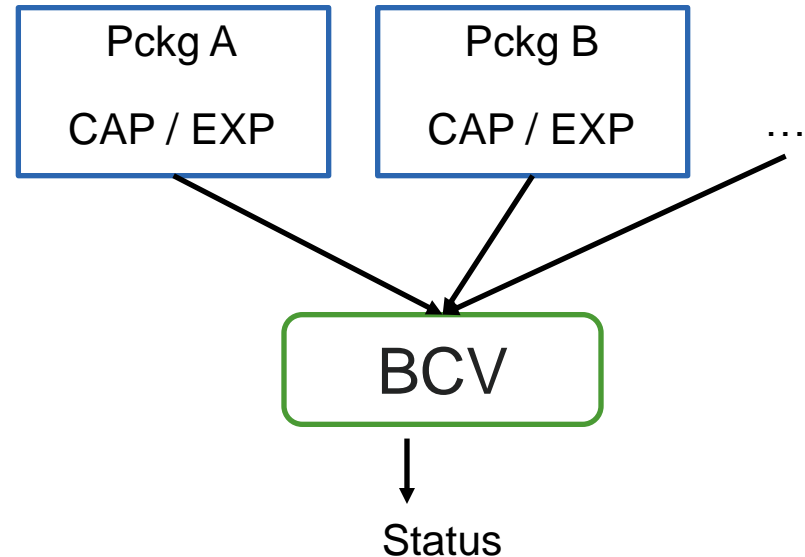

Attack model

- ▶ CAP and EXP files come all from malicious App developer
- ▶ No file modification: they are consistent
- ▶ Verification Authority cannot detect malicious code
 - ⋮ If only BCV is used
 - ⋮ AND if exp files provided are in version 2.2 (specified in Java Card 3.0.5)

JAVA CARD IMPORT MECHANISM

Asymmetry in import mechanism

- ▶ CAP file
 - ⋮ Imported packages are listed in Import component
 - ⋮ Referenced by AID value
 - ⋮ For instance "A0 00 00 00 62 00 01"
- ▶ Export file
 - ⋮ Referenced by the fully qualified name
 - ⋮ For instance "java/lang"

ATTACK SET-UP (1/3)

Pckg: library / AID: DEADBEEF**01**

```
class Phi {  
    Object confusion(Object obj) {  
        return obj;  
    }  
}
```

Pckg: library / AID: DEADBEEF**02**

```
class Phi {  
    Object confusion(short s) {  
        return null;  
    }  
}
```

ATTACK SET-UP (2/3)

Pckg: library / AID: DEADBEEF01

```
class Phi {  
    Object confusion(Object obj) {  
        return obj;  
    }  
}
```

Pckg: library / AID: DEADBEEF02

```
class Phi {  
    Object confusion(short s) {  
        return null;  
    }  
}
```

Pckg: proxy

```
import library; //DEADBEEF01  
  
class PhiProxy extends Phi {}
```

CAP file references DEADBEEF01
EXP file references library

ATTACK SET-UP (3/3)

Pckg: library / AID: DEADBEEF01

```
class Phi {  
    Object confusion(Object obj) {  
        return obj;  
    }  
}
```

Pckg: library / AID: DEADBEEF02

```
class Phi {  
    Object confusion(short s) {  
        return null;  
    }  
}
```

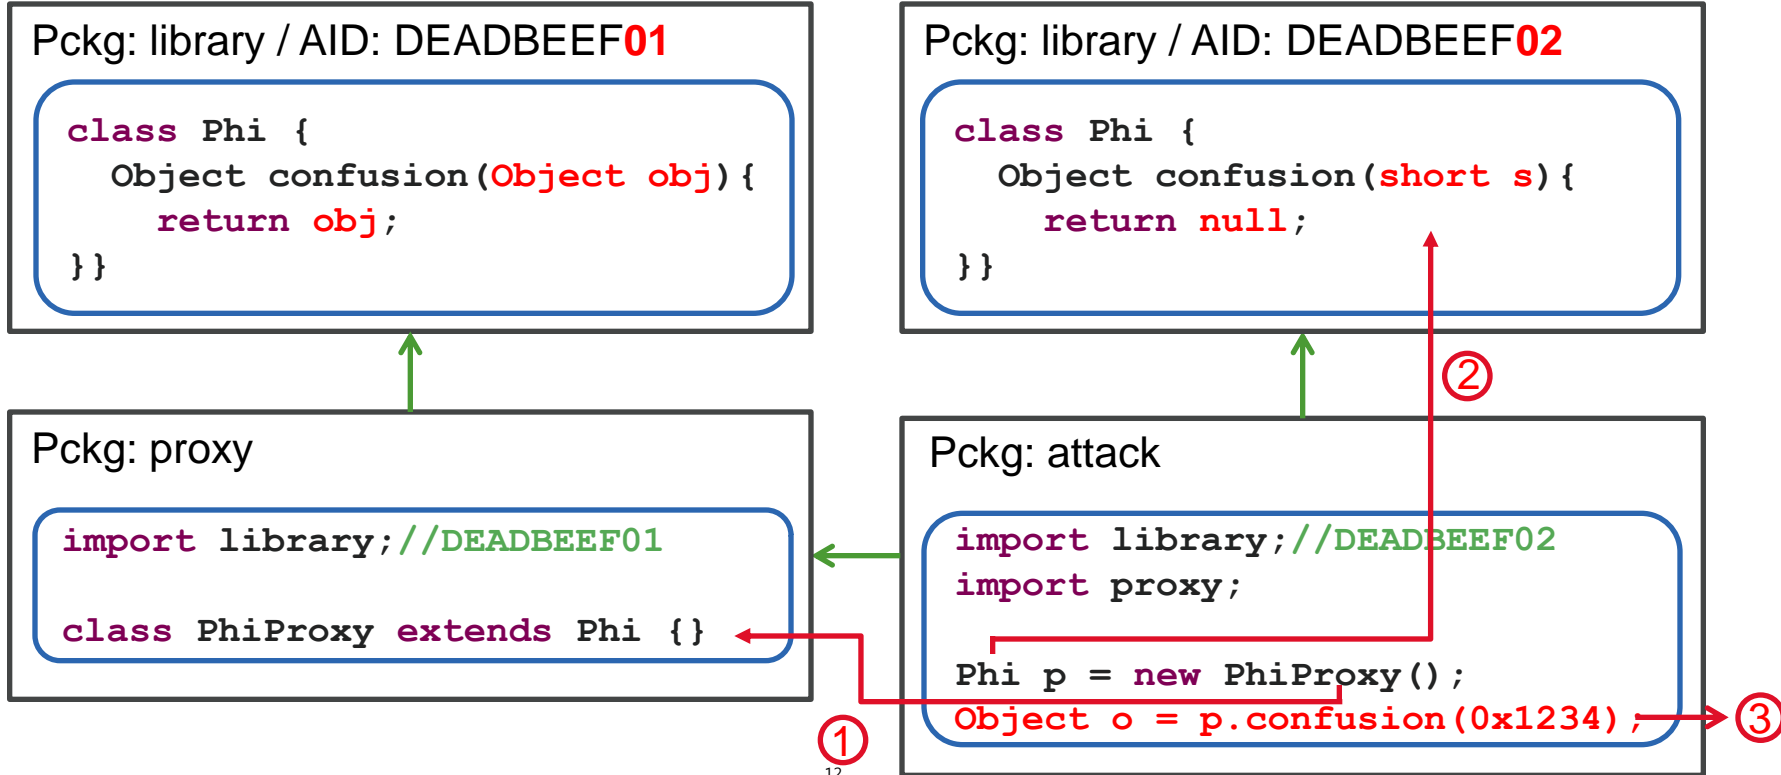

Pckg: proxy

```
import library; //DEADBEEF01  
  
class PhiProxy extends Phi {}
```

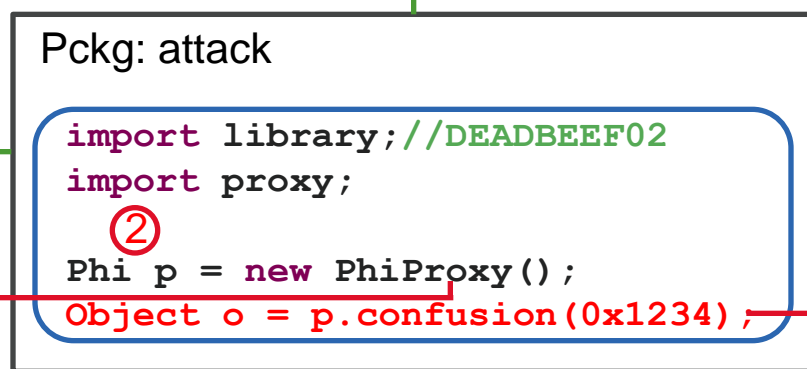

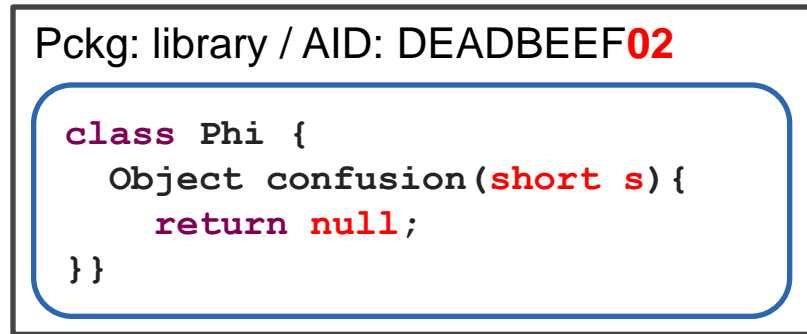

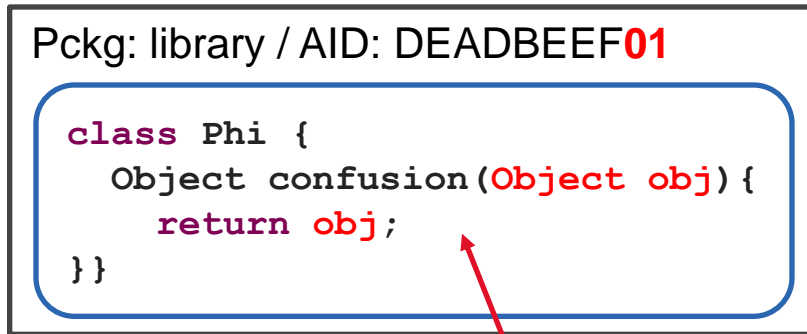

Pckg: attack

```
import library; //DEADBEEF02  
import proxy;  
  
Phi p = new PhiProxy();  
Object o = p.confusion(0x1234);
```

BCV VIEW

AT RUNTIME

PHI – VARIATIONS

- ▶ Principle can be applied everywhere
 - ⋮ On Java Card standard API
 - ⋮ Even on java.lang, with Object (but often forbidden)
- ▶ Going deeper
 - ⋮ Different number of methods
 - ⋮ Overflow in CAP structures, may be powerful
 - ⋮ But more implementation dependent

PHI – SUMMARY

- ▶ Not detected by BCV
- ▶ Due to the lack of information in exp file in version 2.2
- ▶ Not full attack, only a potential weakness
 - ⋮ No assets disclosure,
 - ⋮ But a first step for further investigations:
 - Stack overflow/underflow
 - Type confusion
 - Overflow in CAP structures
 - Etc.

PHI – COUNTERMEASURES

- ▶ Check the AID consistency

- ▶ How ?
 - ⋮ Manually or with a dedicated tool
 - OR
 - ⋮ Force usage of EXPort file version 2.3
 - Defined in Java Card 3.1
 - Each imported package is referenced by its name **AND** its AID
 - But not always available (for instance GlobalPlatform)

THANK YOU FOR YOUR ATTENTION
